2. THIS IS THE SECOND SECTION

The style of table preferred by Kluwer is presented here. There are two aspects of making tables with this macro package that need to be mentioned.

First, you need to enter appropriate commands in order to have the table have the correct appearance. This includes using the command `\sphline` instead of `\hline`, which will add a little vertical space between lines, making your table look more professional and finished.

Second, if you are making tables with vertical lines, which you should only do if the vertical lines are crucial to convey the information in your table, you should use the normal LaTeX command `\hline` instead of `\sphline`.

- Use `\sphline` at the top of the table, underneath the column headers, and at the end of the table.

- Please enter `\it` before each column head, to make the column heads appear in italic.

- You are discouraged from using vertical lines in tables.

- Make your table span the full page width if possible.

The following two examples show these steps being followed and the form of the table preamble that will cause the table to spread out to the width of the page. The second example shows how notes can be made within a table.

Table 1 This is an example table caption. If there is enough text it will form a paragraph.

$\alpha\beta\Gamma\Delta$ *One*	*Two*	*Three*
one	two	three
one	two	three

Table 2 Effects of the Two Types of Scaling Proposed by Dennard and Co-Workers.[a,b]

Parameter	κ Scaling	κ, λ Scaling
Dimension	κ^{-1}	λ^{-1}
Voltage	κ^{-1}	κ^{-1}
Currant	κ^{-1}	λ/κ^2
Dopant Concentration	κ	λ^2/κ

[a] Refs. 19 and 20.
[b] $\kappa, \lambda > 1$.

3. FOOTNOTES

Here is some sample text[1] to show how footnotes print.

Acknowledgments

We would like to thank....
